Filtering of image data by wavelet-based image processing provides a flexible tool for analyzing images. It is necessary to develop new image processing schemes, and this requires the development of new filters. Here, we propose a simple but effective method for the development of new image processing schemes by using new image processing operators obtained from multiscale decompositions of differential operators. The new image processing operators consist of a wavelet packet decomposition and a wavelet Packet Embedded Differentiator. These new operators can be used to develop image processing schemes with various filter lengths, orientations, and smoothness. Because these new operators are based on the differential operator, they are also simpler than conventional image processing operators. A solution to the problem of constructing multiscale differential operators for various types of wavelets is also presented. We conducted a pilot study on a real-world image for visual comparison of the proposed methods and the conventional sinc-based and shearlet-based image processing operators. The results of the study indicate that our new differential operators outperform the conventional ones in terms of the ability to extract relevant information. This study also implies the potential applicability of using differential operators for multiscale image processing in fields other than that of medical imaging, such as communication, vehicle control, and machine control.Q: (Android) Wait for View/Activity to refresh after touch in Pyjamas I'm looking for a way to f678ea9f9e
